

Drinking water supply

important information

The vast majority of water supplied in Scotland is safe for drinking.

In some establishments, particularly those in more remote areas, water may be supplied from a private source separate from the regular mains water supply.

Examples of private sources of drinking water include streams, wells and boreholes.

Although the quality of this water is usually acceptable for drinking, under certain circumstances the quality may be lower than you would expect from a public supply.

The owner of these premises can provide further details about the quality of drinking water in this property, allowing you to make an informed decision.
